## 5.2 工作温度

Operating Temperature

轴承的工作温度通常应在摄氏120°C以下（轴承外环测量温度应当在摄氏100°C以下）。轴承工作温度高于摄氏70°C时，油脂使用寿命比正常工作温度下要缩短。最低工作温度不应低于-10°C。

需要的轴承超出正常工作温度范围时，请与我们联系

The bearings usually operate below the temperature of 120°C(the measuring temperature of the outer ring is 100°C).Grease life reduction has to be taken into account when the bearings continue to operate at a temperaturer above 70°C. The lowest operating temperature should not be lower than -10°C.  
For higher or lower temperature application,please consult us for further informations.

## 5.3 润滑周期

Relubricate Period

正常情形下，油脂的寿命基本等同轴承的使用寿命。可重新润滑式产品，当使用时间比较久时，应当进行定期加脂。注脂周期与轴承的工作速度、温度以及环境均有关系。

下表为标准重新润滑周期表

Under normal operating condition, the grease should conform to the life of the bearings, Relubricatable type bearing units must be perodically greased to assure long life.

The greasing interval is dependent on the bearing running speed, operating temperatures and ambient conditions.  
The following table shows the standard relubrication period.
